TRADE FINANCE TODAY

A lender sees paperwork, not the container.

So it lends blind, or it does not lend. The exporter waits about two months for cash it has already earned, while the cargo itself is at risk in transit.

\$2.5T

global trade finance gap in 2025, about 10% of global trade

ASIAN DEVELOPMENT BANK

80% of banks polled in the latest [Global Trade Finance Gap Survey](#) released by the Asian Development Bank (ADB).

The report, the only global benchmark of unmet demand for trade finance, estimates the global trade finance gap remained at \$2.5 trillion in 2025—unchanged from 2023—and represents about 10% of global trade, down from 10.6%. While this indicates slight progress, the persistently large trade finance gap stifles growth as many firms cannot access the finance they need to maximize trade opportunities.

41%

of SME trade finance applications rejected

ADB SURVEY, DEC 2025

Small and medium-sized enterprise (SME) financing may be expanding, with more than 80% of banks reporting dedicated strategies for supporting SMEs. For the first time, ADB's Global Trade Finance Gap Survey suggests SME rejection rates for trade finance (41%) have fallen to nearly the same level as those for large and mid-cap corporates (40%), though this requires more research.

Nearly 90% of banks surveyed continue to factor environmental, social, and governance (ESG)

52 days

average B2B payment terms in India; 50% of B2B sales on credit

ATRADIUS, 2025

payment policies, offering longer terms to support B2B customer relationships. However, this is heightening exposure to customer payment risks. 50% of all B2B sales are currently made on credit, with average payment terms standing at 52 days.

~\$35B

lost by biopharma each year to temperature-controlled logistics failures

IQVIA, VIA AIR CARGO NEWS

© image(s) licensed by DVV Media

The biopharma industry loses approximately \$35 billion annually as a result of failures in temperature-controlled logistics, according to IQVIA Institute for Human Data Science.

Money became programmable. CargoFlow makes it answer to physical evidence.

Paxos USDG

A US-dollar stablecoin issued by Paxos Digital Singapore for payments, settlement and treasury. In CargoFlow it is the only asset: escrow, tranches, the invoice payment, the waterfall and cover.

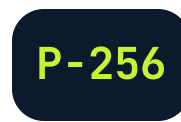

USDG 0x7E95...802F on chain 46630 • real Paxos testnet token, not a mock

Robinhood Chain

An Arbitrum chain built for tokenised real-world assets, with USDG already deployed. Every CargoFlow contract runs there; a facility, its evidence and its settlement share one ledger.

10 contracts source-verified • mainnet reference: chain 4663, USDG listed

Passkeys at chain level

The RIP-7212 P-256 precompile is live on Robinhood Chain, so a buyer can confirm delivery and pay with Face ID through a ZeroDev Kernel smart account: no extension, no seed phrase.

3 ERC-4337 user operations paid a live invoice (CF-SG-VAX-0401)

The Arbitrum stack

Stylus runs the evidence-fusion maths in Rust: measured 19x cheaper than the Solidity reference at 128 readings. Fhenix (encrypted invoice terms) and GMX (financier hedge) extensions run on Arbitrum Sepolia.

611,945 vs 31,511 gas • one chain, one run, method in stylus/README.md

Reefer data loggers already record temperature on every leg. Those readings sit in CSV exports and dashboards; they do not move money. CargoFlow turns them into signed evidence that a contract can act on.

CARGOFLOW IN ONE SENTENCE

A financier escrows USDG per shipment; tranches reach the exporter only when the cargo's **signed sensor evidence** satisfies an on-chain policy; the buyer's one payment repays the financier, pays the exporter and hands over the bill of lading.

PHYSICAL REALITY → CRYPTOGRAPHIC EVIDENCE → EVIDENCE CONFIDENCE → FINANCIAL RISK → AVAILABLE CAPITAL → USDG SETTLEMENT

Meet the **cast**

Illustrative characters · every action they take is a real contract call

Meera
EXPORTER

Registers the shipment and policy, opens the facility, resumes with a proof

Daniel
FINANCIER

Escrows USDG, watches the evidence, gets principal plus fee

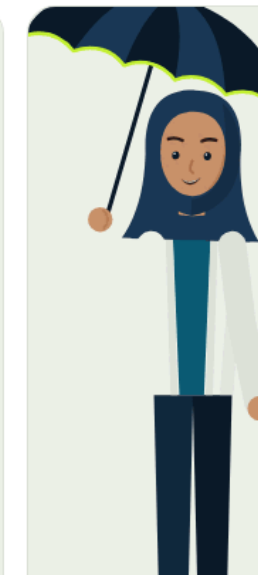

Wei Lin
BUYER

Confirms delivery, pays the invoice, receives the bill of lading

Carrier
SHIP'S OFFICER

Issues the electronic bill of lading (ERC-721)

Insurer
COVER PROVIDER

Offers default cover and parametric cover

Arbiter
DISPUTE ROLE

Resolves disputes; can never release a tranche

FIVE BEATS • REFERENCE NUMBERS

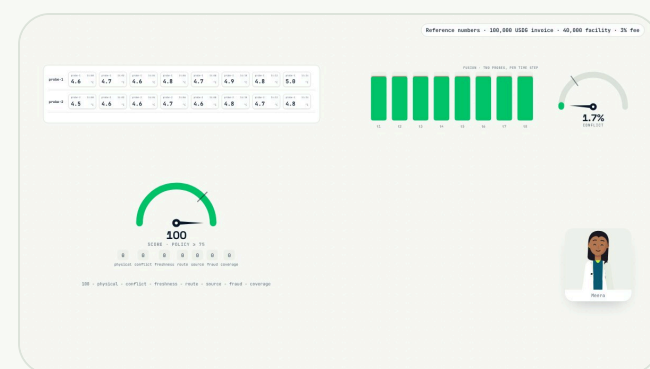

From escrow to settlement, every step on chain.

1 Escrow

Meera registers the shipment and a commit-reveal cold-chain policy (2 to 8 °C, humidity, shock). Daniel deposits the whole 40,000 USDG facility into the vault.

`createFacility` • `depositCapital`

2 Evidence

The logger signs each reading. Eight per sensor close an epoch: probes fused (Dempster-Shafer), conflict measured, scored 0 to 100. Only a salted Poseidon root and the score go on chain.

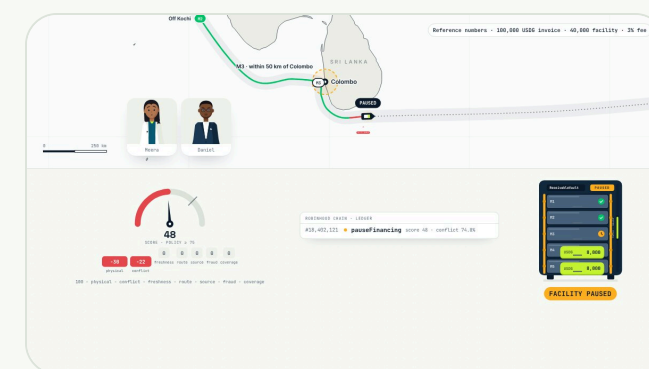

`commitEpoch`

3 Release

Evidence passes the policy in the right place: 8,000 USDG goes to Meera. The contract re-checks the committed epoch itself, whatever the backend asked for.

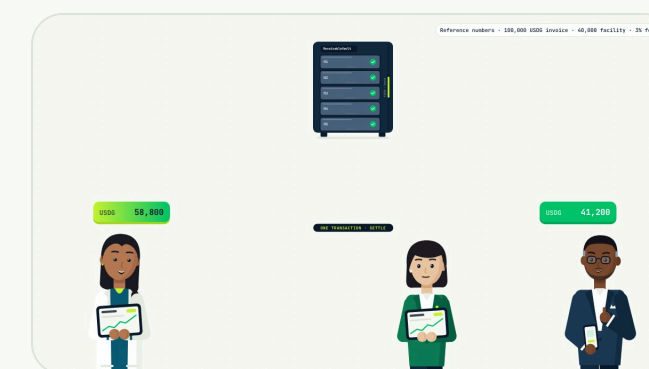

`evaluateAndReleaseMilestone`

4 Pause, then prove

Probe-1 hits 11.7 °C, conflict 74.8%, score 48: releases stop. A Groth16 proof that eight hidden readings of the other probe are in band, bound to this pause, resumes it.

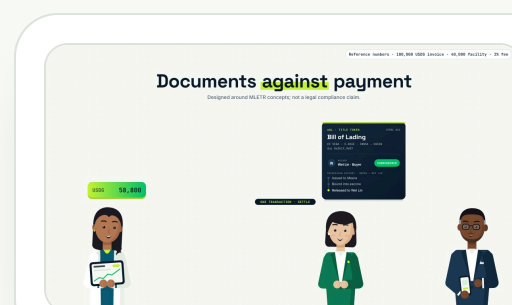

`pauseFinancing` • `resumeWithProof`

5 Settle

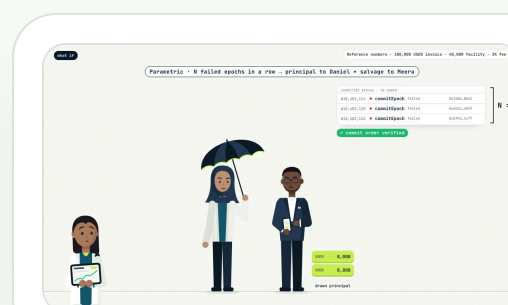

Wei Lin pays 100,000 USDG once: 40,000 principal + 1,200 fee to Daniel, 58,800 to Meera, and the electronic bill of lading to her, in the same transaction.

`markDelivered` • `settle`

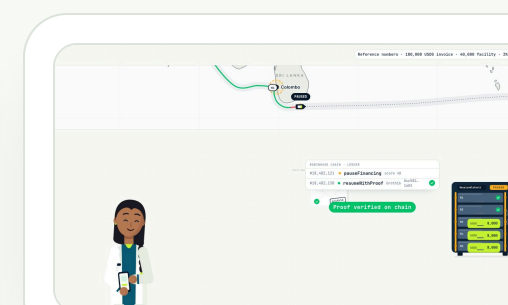

Title moves with the money

The carrier's ERC-721 bill of lading leaves escrow in the buyer's payment transaction.

Default and parametric cover

Pays after N failed epochs in a row, proven from the registry's commit order.

Recovery is automatic

The proof is prepared once a probe has eight fresh in-band readings; the exporter signs once.

REFERENCE NUMBERS

100,000 USDG invoice • 40,000 USDG facility in 5 milestones of 8,000 • 3% fee. The live testnet runs use the same mechanics at 30 / 20 USDG. Disputes go to an arbiter role that can never release money.

Buyer pays with a passkey

Using CargoFlow, summarise the fleet risk and explain any paused shipment.

Used CargoFlow integration, loaded tools >

Fleet overview: there are 5 shipments in total: 1 CREATED, 1 REGISTERED, 1 SETTLED and 2 PAUSED. Of the 4 live ones examined, no shipment other than the two paused ones has weak evidence. Both paused shipments need attention.

Why both are paused

CF-SG-VAX-0201 (0xe7897d68...c8304) and CF-LIVE-1791034258807 (0xd686baeb...50eb5) show the same pattern:

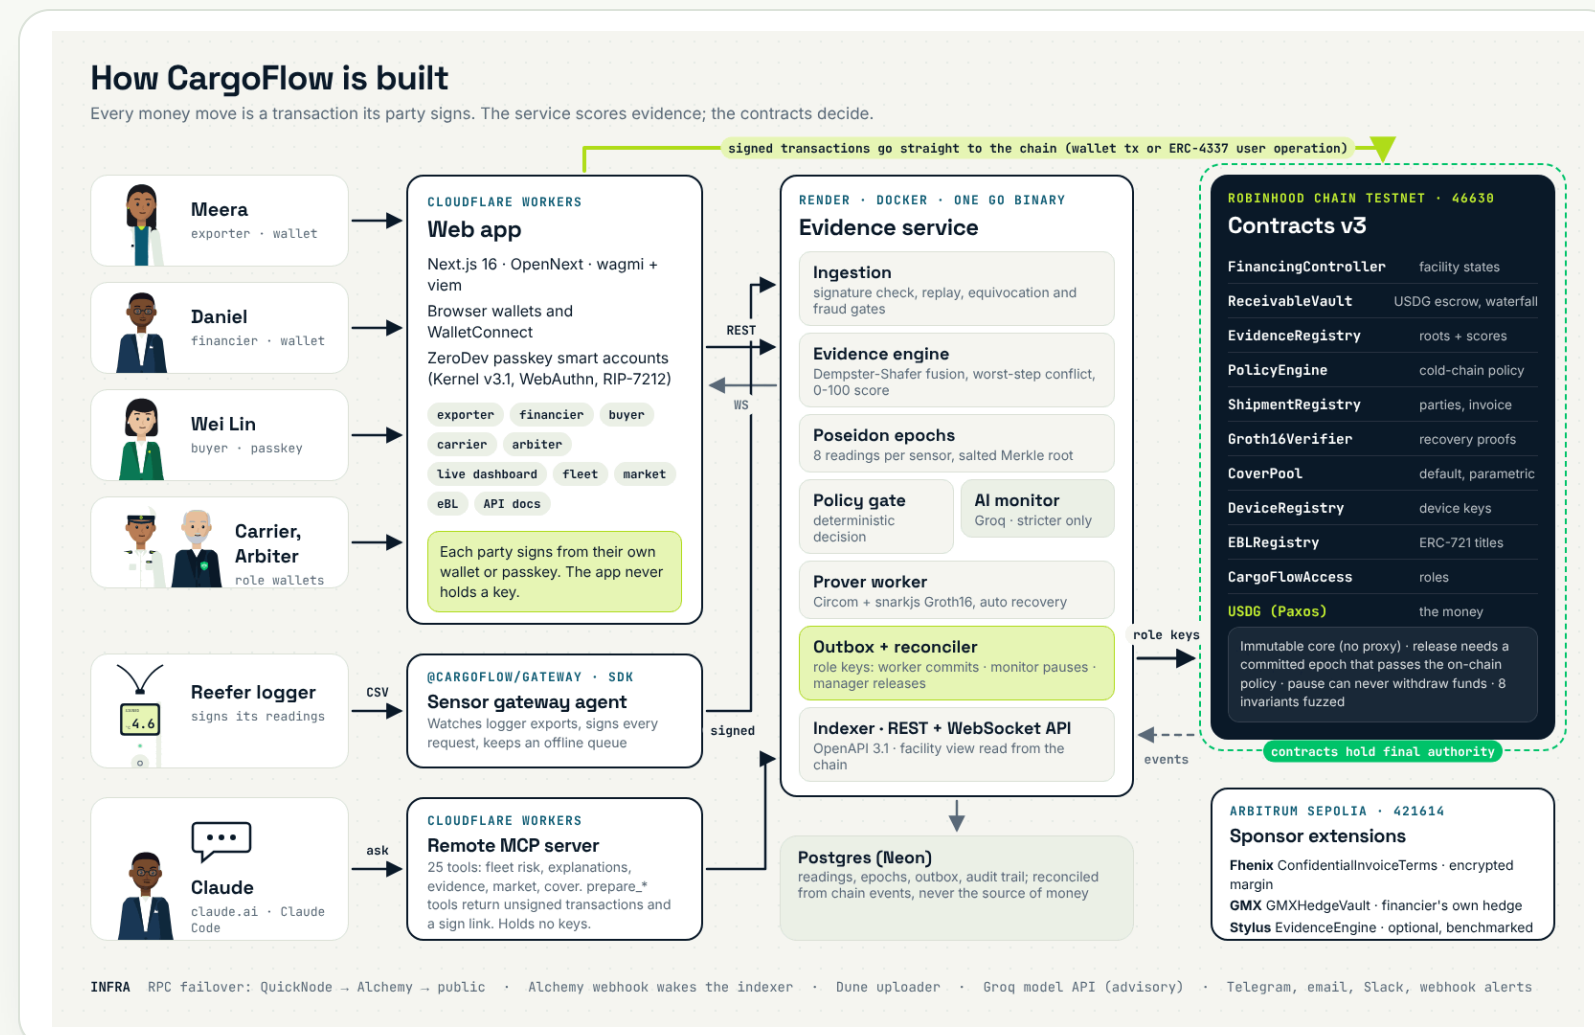

Milestones 1 and 2 passed cleanly, each with an evidence score of 100, about 1.7% sensor conflict and about 4.3% risk. Both were approved to advance.

claude.ai via remote MCP · no keys

One logged reason was score below threshold, non-compliant and conflict too high.

TECHNOLOGY AND MOAT

Evidence, proof, money and title enforce each other.

Evidence engine

Dempster-Shafer fusion across sensors, conflict taken at the worst step (an excursion cannot be averaged away), seven capped penalties, a published 0 to 100 formula. Same input, same score.

Zero-knowledge recovery

Groth16, 13,494 constraints, about 1 s to prove, about 0.25 M gas to verify. Bound to chain, controller, shipment, epoch, policy, submitter and pause count: no replay.

Contracts hold authority

Immutable core (no proxy); eight invariants fuzz-tested; the pause brake stops new risk only, never exits. The AI monitor can only make an outcome stricter, through a pause-only key.

Device trust

Ed25519, P-256 secure elements (X.509 chain to manufacturer roots) or passkeys. Device class weights reliability; every epoch records its source devices on chain.

Electronic bill of lading

ERC-721 title per bill, held in escrow and released in the buyer's payment transaction: documents against payment. Designed around MLETR concepts, not a legal claim.

Parametric cover

Pays after N consecutive failed epochs, proven from the EvidenceRegistry's commit order: principal to the financier, salvage to the exporter. Pull-based payouts.

HARD TO COPY

Not one feature but the chain of them: signed device readings, a fusion score, a circuit bound to the contract's own public signals, a vault that only the controller can release, and a title registry that moves with the payment. A copy needs all five, tested together (366 contract tests, 25 circuit tests).

HONEST TESTNET TRACTION

Working on a public chain, with receipts.

NO USERS OR REVENUE YET · TESTNET ONLY · NOT AUDITED

LIVE RUN	WHAT HAPPENED	ON CHAIN
CF-SG-VAX-0202 the film's shipment	Through the website, each party in its own session: carrier's bill of lading, logger CSVs, an excursion, automatic ZK recovery (proof ready 45 s after the recovery readings), settlement.	proof 0x79c68fc0... settle 0xabba66b6...

Start with one corridor, inside a \$2.5T gap.

TAM	Global trade finance gap in 2025, about 10% of global trade (Asian Development Bank, 15 Jan 2026)	\$2.5T
SAM	India's pharmaceutical exports, FY 2024-25: \$30.47B (Government of India, PIB) × 50% of B2B sales made on credit (Atradius India 2025) A1	~\$15.2B
SOM	1% of SAM financed through CargoFlow by year 3 A2	~\$152M
REVENUE	Planned protocol fee of 30 to 50 bps on financed volume A3 , before cover and SaaS revenue	\$0.46M to \$0.76M / yr
CAPITAL	At 52-day average terms (Atradius) a facility turns about 7 times a year, so \$152M of volume needs about \$22M of financier capital outstanding A4	~\$22M

ASSUMPTIONS, STATED

A1 Atradius' India-wide B2B credit share applies to pharma exports. **A2** 1% share is a target, not a forecast. **A3** fee level is planned; today's contracts charge no protocol fee. **A4** 365 / 52 ≈ 7 turns, full utilisation. Expansion beyond pharma (frozen food, chemicals, other lanes) is not counted. Cold-chain losses of ~\$35B a year in biopharma alone (IQVIA) are the demand for cover.

BUSINESS MODEL

Paid when capital moves, not before.

PLANNED • NOT YET IN THE CONTRACTS

01 • PRIMARY

Protocol fee on financed volume

30 to 50 bps of each facility's drawn amount, taken inside the settlement waterfall the contract already runs. No fee if nothing is drawn.

Reference facility: 40,000 USDG drawn $\times$ 40 bps = **160 USDG** to the protocol; the financier's own fee (3% here, **1,200 USDG**) is set per facility.

02 • RISK

Share of cover premiums

Insurers write default and parametric cover through the CoverPool; CargoFlow takes a share of the premium. The insurer keeps the risk; the evidence trail prices it.

Built today: default cover pays min(cover, drawn principal); parametric cover pays after N failed epochs, proven on chain.

03 • SOFTWARE

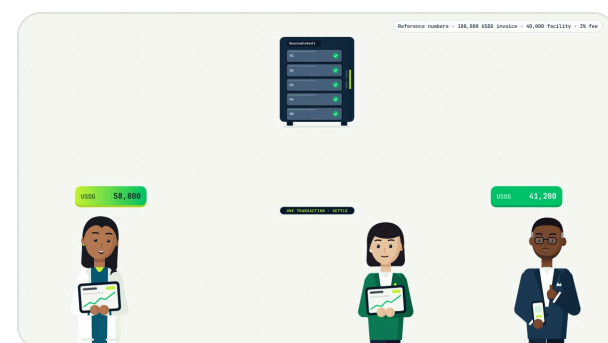

SaaS for financiers and data

Portfolio risk, exposure and Monte Carlo of default and recovery, evidence API and MCP access for credit funds, insurers and logger vendors; seat or volume pricing.

Built today: Python SDK (portfolio, VaR / ES), TypeScript SDK, remote MCP, OpenAPI 3.1 reference, Dune queries.

Non-custodial by design. The ReceivableVault is the sole USDG custodian and pays out only on the controller's rules. CargoFlow software never holds client funds; financiers lend, insurers insure.

Honest today. The contracts charge no protocol fee yet. Adding it is a waterfall change that ships with the audited mainnet release (milestone M3), alongside work with licensed financiers.

THE WATERFALL ALREADY RUNS ON CHAIN • REFERENCE FACILITY

58,800 exporter residual

40,000 principal

1,200

One 100,000 USDG invoice payment: principal and the 3% fee to the financier, the rest to the exporter, the bill of lading to the buyer. The planned protocol fee is one more line in this split.

LANDSCAPE, BY CATEGORY

Each category solves one piece. **None ties money to the cargo.**

CATEGORY	SEES CARGO CONDITION	RELEASES PER MILESTONE ON EVIDENCE	PAYMENT AND TITLE TOGETHER	TELEMETRY STAYS PRIVATE	STABLECOIN SETTLEMENT	WHERE THEY WIN
Bank trade finance letters of credit, documentary collections						Lowest cost of capital, regulated, trusted by every counterparty. Paper-based, slow, and 41% of SME applications rejected.
Factoring and invoice-finance fintechs receivables advanced against the buyer's credit						Fast onboarding and simple products. Underwrite the invoice and buyer, not the goods in transit; money moves up front.
Cold-chain monitoring vendors data loggers and visibility platforms						Hardware in the container and real-time alerts. Their data informs people; it does not move money. Partners, not rivals.
On-chain RWA credit protocols pooled private credit with stablecoins						On-chain liquidity and transparent pools. Underwriting happens off chain at pool level, on borrower attestations.
CargoFlow evidence-gated facility per shipment						The combination. Weaknesses we own: testnet only, not audited, no physical secure-element board run yet, needs financiers.

yes partly (on documents, not sensor evidence) not a design goal of the category

GO-TO-MARKET

One corridor first: India pharma → Singapore.

PLAN

Why this lane. India exported \$30.47B of pharmaceuticals in FY 2024-25 (PIB) and sells half of B2B volume on 52-day credit (Atradius). Singapore is the importer and hub, home of USDG's issuer (Paxos Digital Singapore) and of the buildathon's Founder House.

DOOR 1 • LOGGER VENDORS

Make existing loggers finance-ready

@cargoflow/gateway already signs and sends logger exports (folder watch, USB, serial, offline queue). Vendor presets for Sensitech, Elitech and ELPRO exist and are marked experimental until checked against real exports.

DOOR 2 • CREDIT FUNDS AND FINANCIERS

Short-tenor USDG yield with evidence attached

The market lists open requests with a suggested fee band; the Python SDK, MCP server and settlement certificates give underwriters the evidence trail per facility.

DOOR 3 • EXPORTERS VIA FORWARDERS AND INSURERS

Onboard through who they already use

Freight forwarders bring shipments; insurers bring parametric cover. The exporter wizard's Pharma template fills 2 to 8 °C, humidity and shock in one click.

PILOT
TARGET

3 exporters, 1 financier, 1 logger vendor on this lane; then more lanes and cold-chain categories.

ROADMAP · EACH MILESTONE HAS AN EXIT TEST

From testnet to the first real facility.

PLAN · MAPS TO MILESTONE-BASED GRANTS

• M0 DONE

Contracts v3 deployed and verified on Robinhood Chain Testnet; live web app, API and MCP; passkey payments; ZK recovery on chain; four packages published; 366 / 25 / 296 / 18 tests.

M1

Security

- Independent audit of the v3 core contracts
- Public Groth16 ceremony to replace the single-party setup
- Admin and verifier role governance

35% of grant · audit and ceremony

EXIT TEST

Audit report published, every finding fixed or accepted in writing

M2

Real evidence

- Logger pilots on real shipments
- Vendor presets verified against real exports
- First secure-element board (P-256, X.509) run end to end

25% of grant · pilots and hardware

EXIT TEST

3 real shipments evidenced on chain from physical loggers (target)

M3

Mainnet

- Deploy on Robinhood Chain mainnet with real USDG, per-facility caps
- Protocol fee in the waterfall
- Multi-instance backend, proof queue

20% of grant · mainnet and first facilities

EXIT TEST

First facility funded by an outside financier and settled in real USDG

M4

Legal and title

- Legal opinion on the eBL under MLETR-based law (Singapore first)
- Structure with a licensed financier
- Carrier or forwarder eBL pilot

10% of grant · legal

EXIT TEST

Written opinion; one bill of lading issued by a real carrier

M5

Scale

- Scoring calibrated on pilot data
- Pooled financier vault (ERC-4626)
- Second lane and cargo category

after the grant · revenue or next round

EXIT TEST

Calibration report public; second corridor live

Production gaps as listed in docs/architecture.md ("What would change for production") and README "Honest limits" · later phases: docs/project/22-advanced-roadmap.md

13 / 16

THE ASK AND USE OF FUNDS

Prize and milestone grant fund **M1 to M4**: audit, real evidence, mainnet, legal.

PLAN

35%		25%		20%		10%	10%
■ 35%	Security audit and public ZK ceremony Core contracts (controller, vault, evidence, policy, cover, title, devices) and the circuit.	M1	10,500 USDG				
■ 25%	Pilots and logger hardware Loggers and secure-element boards for real shipments on the India to Singapore lane.	M2	7,500 USDG				
■ 20%	Mainnet launch and first facilities Deployment, a capped first-loss / cover seed so the first financier is not alone.	M3	6,000 USDG				
■ 10%	Legal MLETR opinion on the bill of lading and structuring with a licensed financier.	M4	3,000 USDG				
■ 10%	Team and infrastructure Hosting, RPC, prover capacity for six months.	all	3,000 USDG				

HOW THE NUMBERS READ

Amounts show the split applied to the buildathon's milestone grant of up to **30,000 USDG**. Any prize is applied to the same plan in the same proportions; a larger amount deepens the audit first.

RELEASED LIKE A CARGOFLOW FACILITY

Each tranche is tied to a milestone's exit test (slide 13), so funders see evidence before the next release: the same rule CargoFlow applies to cargo.

ARBITRUM OPEN HOUSE SINGAPORE • JUDGING CRITERIA

Every criterion, with something to click.

REQUIREMENT

Deployed on an Arbitrum chain

All ten core contracts live and source-verified on Robinhood Chain Testnet (46630); Stylus, Fhenix and GMX pieces on Arbitrum Sepolia.

CRITERION

Smart contract quality

366 contract tests (unit, fuzz, eight invariants, real-proof integration, smart-account callers); immutable core, no proxy; OpenZeppelin 5.4; Slither triaged; an authority matrix that lists what each role cannot do; a pause that can never block an exit.

CRITERION

Product-market fit

A sourced problem (\$2.5T gap, 41% SME rejections, 52-day terms); portals for exporter, financier, buyer, carrier and arbiter; a market with fee guidance; SDK, MCP, gateway and Python packages published.

CRITERION

Innovation and creativity

Capital gated by fused sensor evidence; context-bound ZK recovery; an AI monitor that can only tighten; parametric cover proven from commit order; a bill of lading that moves inside the payment; Claude as a keyless co-pilot.

CRITERION

Real problem solving

End-to-end runs on the public testnet with every transaction linked: excursion, pause, proof, resume, settlement, passkey payment.

EXTRA CONSIDERATION

Paxos USDG

USDG is the only money: escrow, tranches, invoice payment, waterfall and cover, on the real Paxos testnet token `0x7E95...802F`.

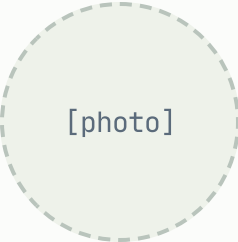

RESERVED PRIZE

Robinhood Chain

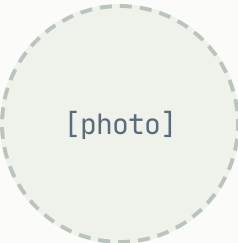

Built on Robinhood Chain first, not ported: its RIP-7212 precompile carries the passkey flow, and at least one of the three overall prizes is reserved for a Robinhood Chain project.
